

Module 1: SQL & Relational Database

Lesson 2: Information & Data Models

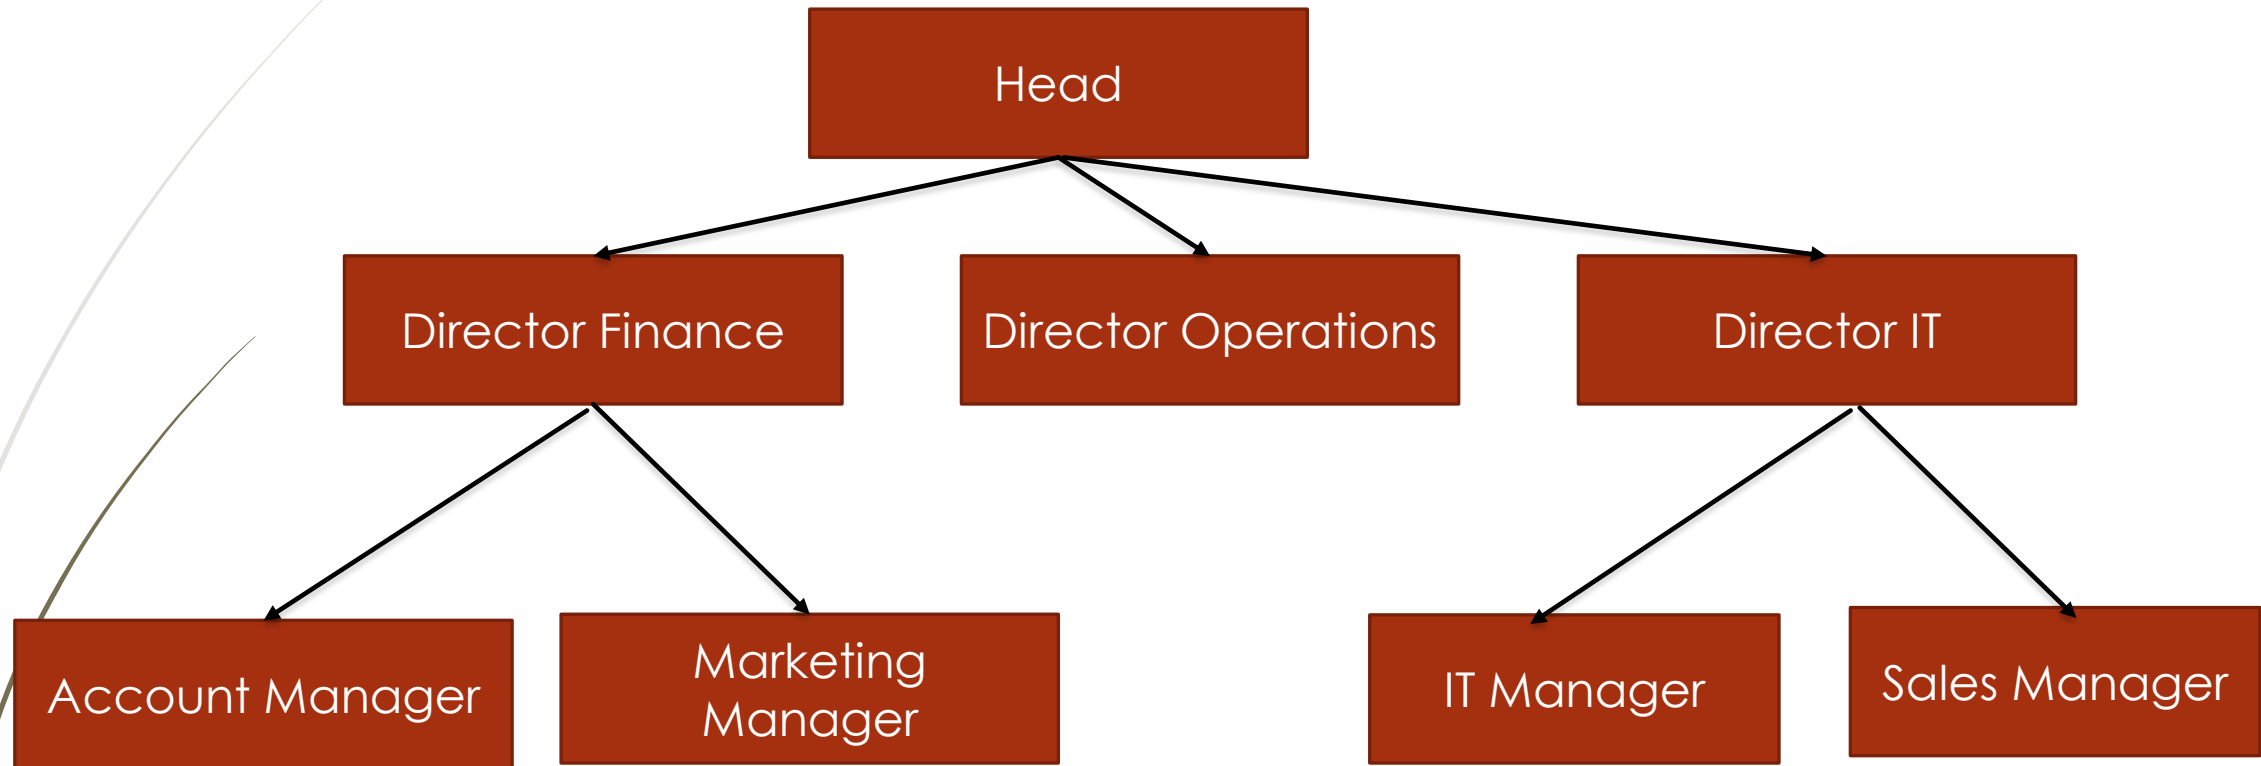

- Information Model
- Data Model
- Different types of Data Models
- Advantages of Relational Model
- Difference between Entity & an attribute

Information Model vs Data Model

- **Information Model** – Conceptual information about different entities (High Level)
- **Data Model** - Defined at more concrete level and defines relationship between objects.

Types of Information Models: Hierarchical

First Hierarchical Database management system – Information Management System released by IBM in 1968 for Apollo Space program

Relational Model

- Most used Data model
- Allows for data independence
- Data is stored in tables

Logical data independence

Physical data independence

Physical storage independence

Entity Relationship Model

- Used as a tool to design relational databases
- Building Blocks – Entities and Attributes

Entity Relationship Diagram

- Simplified library example
- Author as an entity

Summary

- Information Models vs Data Models
- Entity Relationship Models
